Let All Blues Rejoice – REG ALCORN (2019)

Reg Alcorn

Stéphane Vinatier & Reg Alcorn. "Les mathématiques vues par un artiste : des objets mathématiques qui inspirent". In *La Gazette de la Société Mathématique de France*, **181**, July 2024.

Reg Alcorn

William Reginald Alcorn was born in Zambia in 1950 to Irish and Scottish parents. He developed a passion for painting at a very early age. After studying humanities in England, he travelled around Europe, eventually settling in France. With projects in music, languages, science and, more recently, mathematics, he divides his time between his painting studio and popularising the arts, notably as part of the activities of the IREM of Limoges.

Poincaré's Breakfast (2012)

A desire for geometry

Like several other artists before him (Picasso, Mondrian, Kandinsky, Vasarely, Morellet...), Reg Alcorn was looking for a geometric process to structure the canvases of a series of paintings, that he would call *Transitions*:

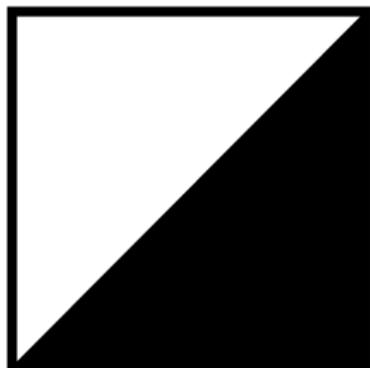

A desire for geometry

He picked into mathematical objects he discovered during former collaborations:

Truchet

Révérend Father Sébastien Truchet (1657–1729) was a mathematician, typographer, “clockmaker, great canal specialist, inventor of countless machines (cannons, tree-transplanting machines, sundials, etc.) including the famous mechanical tables of Marly”

Truchet

Révérend Father Sébastien Truchet (1657–1729) was a mathematician, typographer, “clockmaker, great canal specialist, inventor of countless machines (cannons, tree-transplanting machines, sundials, etc.) including the famous mechanical tables of Marly”

Truchet's treatise is of considerable importance for it is in essence a graphical treatment of combinatorics, a subject that, under the influence of Pascal, Fermat and Leibniz, was at the forefront of mathematics at the time.

Ulam

Stanislaw Ulam (1909-1984), was a polish mathematician, who migrated to the USA in the 30's. He joined the *Manhattan project* in 1943 and took part to the conception of the atomic bomb, at the Los Alamos laboratory; made a decisive contribution to the development of H bomb; made important contributions in several domains of fundamental mathematics.

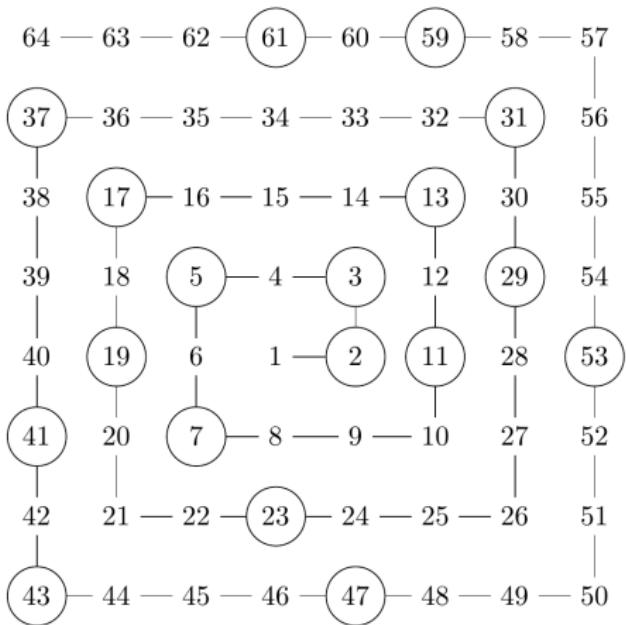

Ulam

Stanislaw Ulam (1909-1984), was a polish mathematician, who migrated to the USA in the 30's. He joined the *Manhattan project* in 1943 and took part to the conception of the atomic bomb, at the Los Alamos laboratory; made a decisive contribution to the development of H bomb; made important contributions in several domains of fundamental mathematics.

While getting bored during a conference in 1963, he began to draw a grid on a sheet of paper to represent a chessboard; changing his mind, he began to number the intersections starting from the center of the grid and spiraling around it in an anti-clockwise direction; then he began to circle the prime numbers and, to his great surprise, saw lines forming along the diagonals.

Euler's formula

The function

$$E(n) = n^2 + n + 41$$

Euler's formula

The function

$$E(n) = n^2 + n + 41$$

takes

- 40 distinct prime values at consecutive integers ($0 \leq n \leq 39$)
- 47.5% of prime values among values up to 10 000 000

Euler's formula

The function

$$E(n) = n^2 + n + 41$$

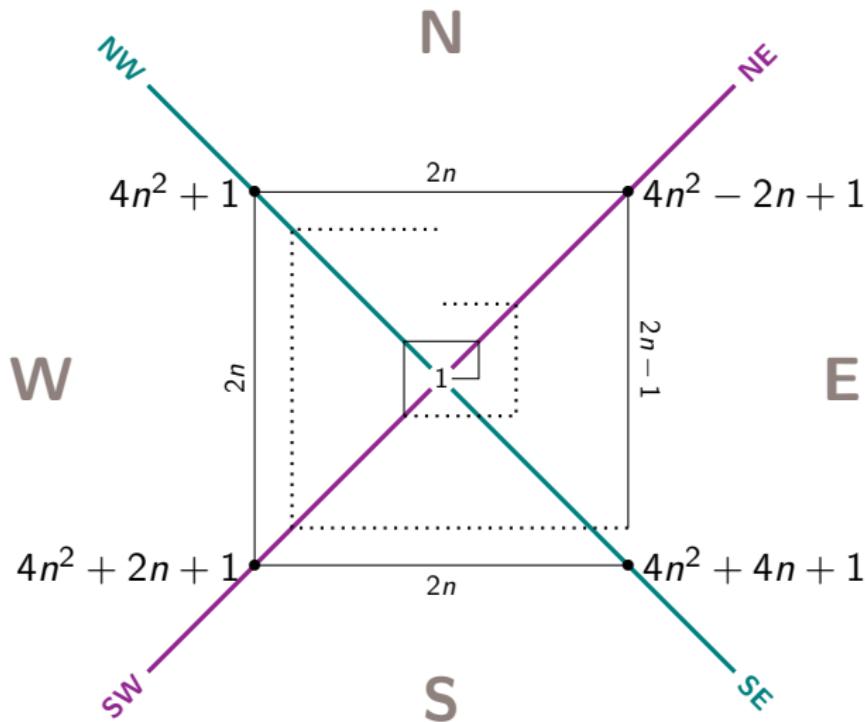

takes

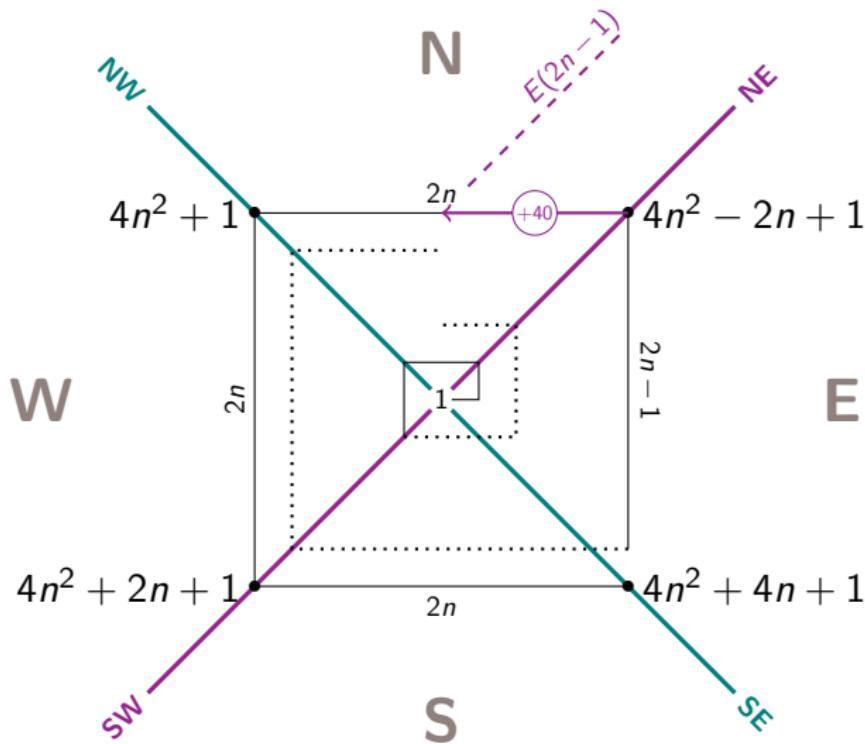

- 40 distinct prime values at consecutive integers ($0 \leq n \leq 39$)
- 47.5% of prime values among values up to 10 000 000

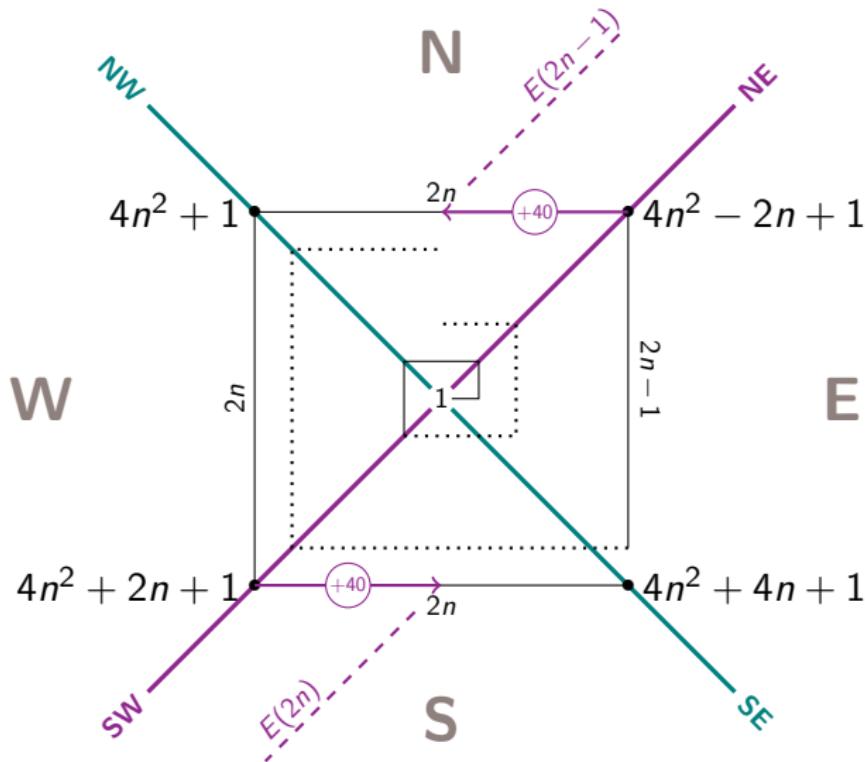

One computes:

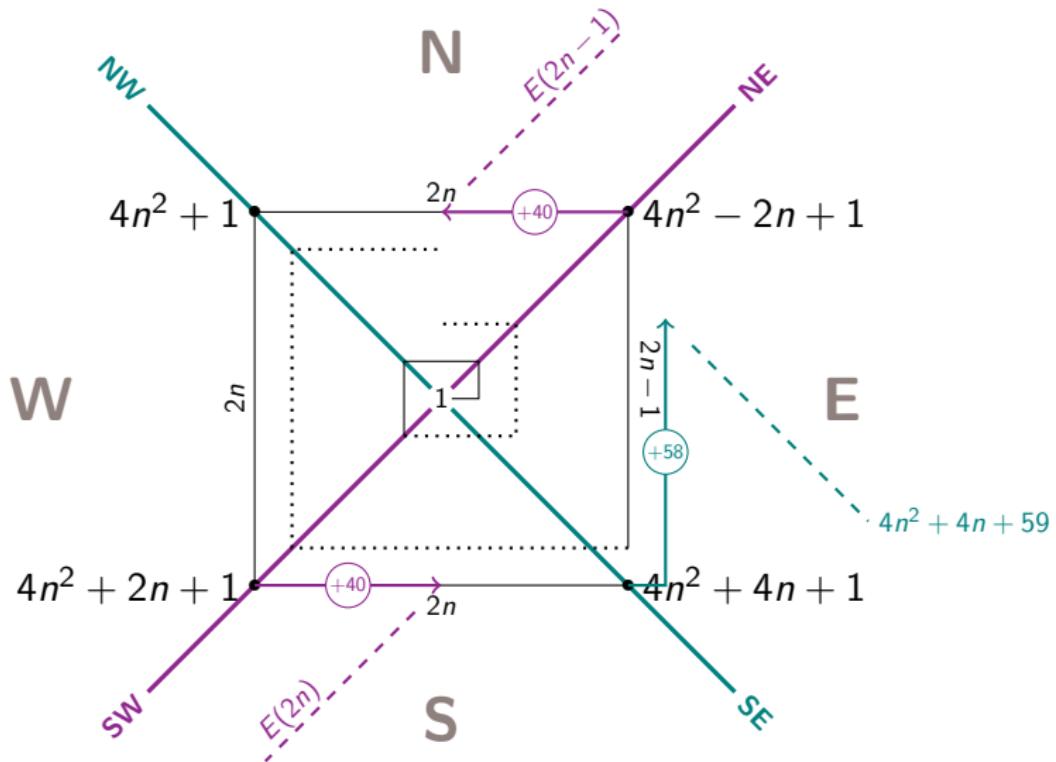

$$E(2n - 1) = (4n^2 - 2n + 1) + 40$$

$$E(2n) = (4n^2 + 2n + 1) + 40$$

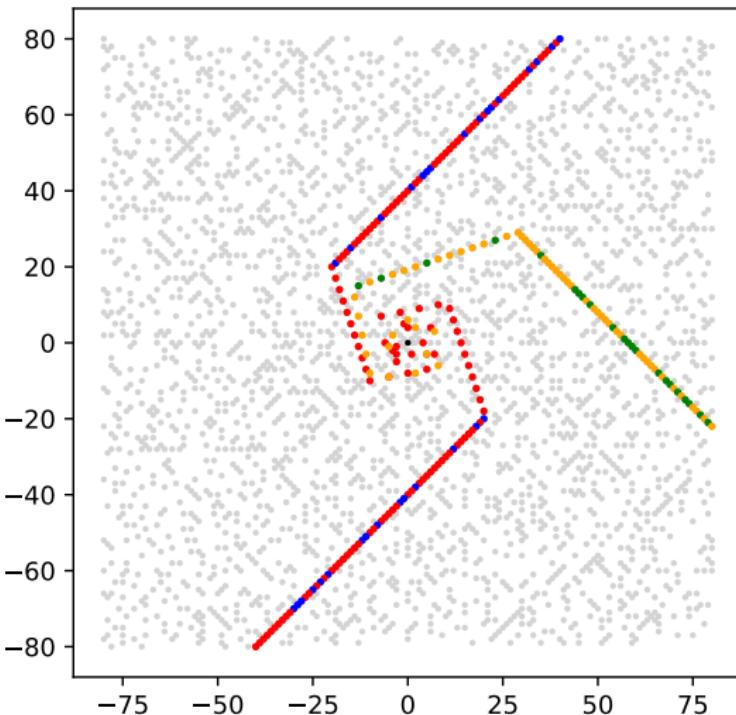

Ulam and Euler and ...

$E(n)$ for $n \leq 160$:
prime values
other valeurs

$4n^2 + 4n + 59$
for $n \leq 80$:
prime values
other values
